info@filanest.com

We are able to deliver the house to the customer both in the developer's condition, as well as designed by our designers and finished interior.

Likewise sauna cabins, the cottage houses are also manufactured with the use of our patented technology. It uses carbon fiber strings that are woven by an industrial robotic arm thus creating an openwork and lightweight truss of outstanding strength and durability. Both the cottage houses' innovative shape and their core design make them resistant to any extreme weather phenomena like violent storms or high winds.

When designing cottage houses we put a great effort into making them as sustainable as they can get. Vast majority of the materials used to build our 35m² cottage house is reusable and has a low carbon footprint.

If you own a piece of land and wish to own a cottage house, you can still enjoy it this summer! We are ready to ship the house within 5 weeks since you place your order!
